

Talks Media - Frontend developer test

Hi dev :)

This is a brief document related to the test that you're going to take to show us your amazing skills and abilities.

There's no one correct way to succeed in this little project, we want to see your personal approach at solving problems!

What we expect from you is a working solution and, of course, you can impress us with the following points:

- Apply "Clean Code" best practices.
- Apply "SOLID" principles.
- Write readable code.
- UX solution adopted.

These are the things that you have to do:

1. Start from the project in the provided zip file.
2. Create a page with a table that displays data from the <https://rapidapi.com/contextualwebsearch/api/web-search/> (or others API).
3. The table must have the pagination functionality and filter **for all parameters allowed by the API.**
4. Create tests with Cypress (<https://www.cypress.io/>) where requests are mocked and pagination and filtering functions are tested.
5. Provide us a link to a public repository to evaluate your work ;)

Optionally, to demonstrate that you're the correct person for the job you can:

- Add tools to the project to properly format the code.
- Add tests with Mocha (<https://mochajs.org/>).
